

### Oneseed Juniper Woodland (27)

*Location.* Open to closed juniper woodlands occur on the higher plateaus of the southern part of the project area. All woodlands are included in this map class, whether they have a sparse understory on cinder, or a relatively dense understory of grass and shrubs, as pictured above. The trees thin out toward the north, until they disappear entirely north of the park-Babbitt Ranches boundary.

*Photosignature.* The brown dots that represent juniper crowns are diagnostic. They may occur in a matrix of smooth white (usually grassland), rough light gray (rabbitbrush-grass understory), or greenish black (sparsely vegetated cinder understory).
